Al Ethics & Safety

What is Artificial Intelligence?

What is Intelligence?

Definition from Merriam-Webster

intelligence noun

in·tel·li·gence (in-ˈte-lə-jən(t)s ◄)

Synonyms of intelligence >

1 a (1): the ability to learn or understand or to deal with new or trying situations:

REASON

also: the skilled use of reason

(2): the ability to apply knowledge to manipulate one's environment or to think abstractly as measured by objective criteria (such as tests)

b: mental acuteness: **SHREWDNESS**

c Christian Science: the basic eternal quality of divine Mind

2 a: INFORMATION, NEWS

 $\boldsymbol{b}:$ information concerning an enemy or possible enemy or an area

also: an agency engaged in obtaining such information

The Goal of Al

"Have machines solve problems that are challenging for humans."

We call such a machine an intelligent agent.

Narrow Al

 An intelligent agent that can solve a specific problem.

E.g., drive a car or play chess.

Artificial General Intelligence (AGI)

• A hypothetical intelligent agent which can understand or learn any intellectual task that human beings can. [Wikipedia: AGI]

Artificial Superintelligence

 A hypothetical intelligent agent possessing intelligence surpassing that of the brightest and most gifted human minds. [Wikipedia: Superintelligence]

How can we achieve this? Create an agent that can:

Think like a human?

Act like a human?

Think rationally?

Act rationally?

Think like a human?

Act like a human?

Think rationally?

Act rationally?

The brain as an information processing machine.

 Requires scientific theories of how the brain works.

Note: The brain does not work like artificial neural networks from machine learning! How to understand cognition as a computational process?

- Introspection: try to think about how we think.
- Predict the behavior of human subjects.
- Image the brain, examine neurological data

Al consciousness

- What does it mean that a machine is conscient/sentient?
- How can we tell?
- What do we do then?

Moral

Philosophy

Cognitive Sciences

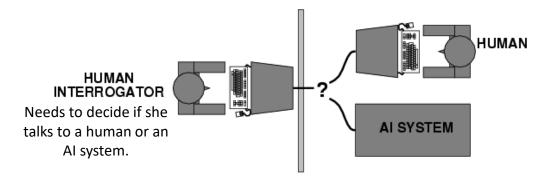

Think like a human?

Act like a human?

Think rationally?

Act rationally?

- Alan Turing rejects the question "Can machines think?"
- The Turing Test tries to define what acting like a human means.

- What capabilities would a computer need to have to pass the Turing Test?
 These are still the core AI areas.
 - Natural language processing
 - Knowledge representation
 - Automated reasoning
 - Machine learning
- Turing predicted that by the year 2000, machines would be able to fool 30% of human judges for five minutes.
 ChatGPT (2023) is probably doing a least that!

Alan Turing (1950)
"Computing
machinery and
intelligence"

Turing Test: Criticism

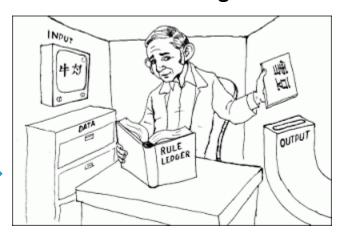

What are some potential problems with the Turing Test?

- Some human behavior is not intelligent.
- Some intelligent behavior may not be human.
- Human observers may be easy to fool.
 - A lot depends on expectations.
 - Anthropomorphic fallacy: humans tend to humanize things.
- Imitate intelligence without intelligence. E.g., the early chatbots ELIZA (1964) simulates a conversation using pattern matching.

Is passing the Turing test a good scientific goal?

- Engineering perspective: Imitating a human is not a good way to solve practical problems.
- We can create useful intelligent agents without trying to imitate humans.

Chinese Room Argument

Thought experiment by John Searle (1980): Imitate intelligence using rules.

Think like a human?

Act like a human?

Think rationally?

Act rationally?

- Thinking Rationality: Draw sensible conclusions from facts, logic and data.
- Logic: A chain of argument that always yield correct conclusions. E.g., "Socrates is a man; all men are mortal; therefore, Socrates is mortal."
- Logic-based approach to AI: Describe a problem in formal logic notation and apply general deduction procedures to solve it. Issues:
 - Describing real-world problems and knowledge using logic notation is hard.
 - Computational complexity of finding the solution.
 - Much intelligent or "rational" behavior in an uncertain world cannot be defined by simple logic rules.

Example: What about the logical implication

 $study\ hard \Rightarrow A\ in\ my\ AI\ course$

Should it rather be

study hard AND be lucky AND ... \Rightarrow A in my AI course

Think like a human?

Act like a human?

Think rationally?

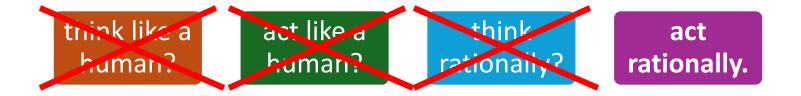

Act rationally?

Acting rational means to try to achieve the "best" outcome.

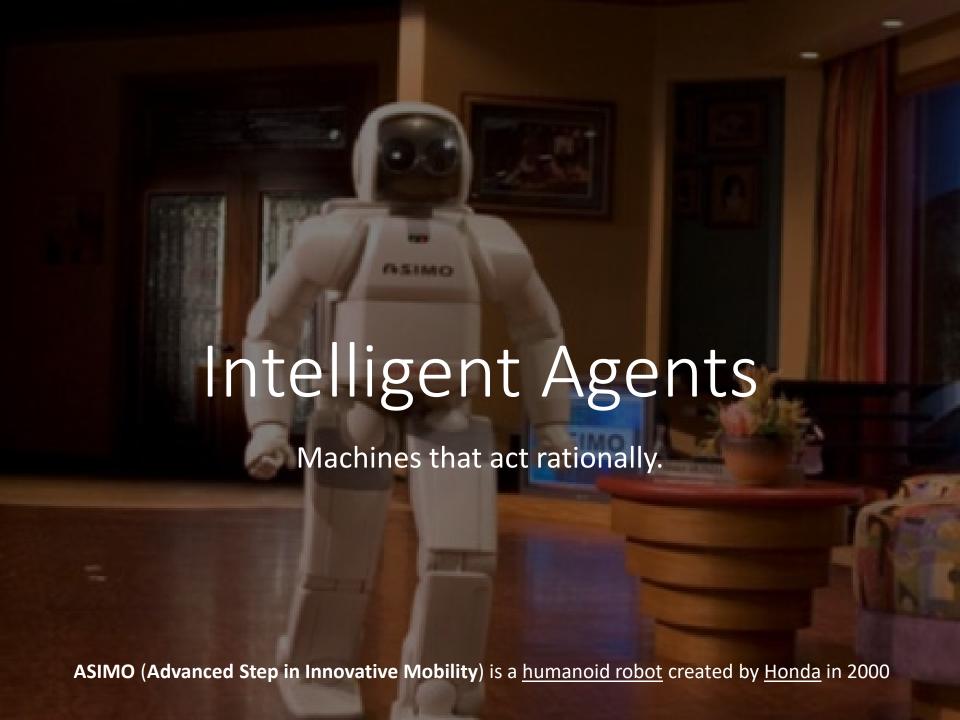

- Best means that we need to do optimization.
- The desirability of outcomes can be measured by the economic concept of utility. If there is uncertainty about achieving outcomes, then we need to maximizing the expected utility.
- Optimization has several advantages:
 - **Generality**: optimization is not limited to logical rules.
 - Practicality: can be adapted to many real-world problems.
 - **Well established**: existing solvers and methods for simulation and experimentation.
 - Avoids philosophy and psychology in favor of a clearly defined objective.
- **Bounded rationality:** In practice, expected utility optimization is subject to the agent's knowledge and computational constraints. The agent needs to do the best with its knowledge and resources.

The Type of AI is Covered in this Course

This course focuses on the computational techniques needed to creating a **narrow Al agent** that can

That is, create a machines that acts in a way to solve a specific hard problem that traditionally would have been thought to require human intelligence.

Components of an Intelligent Agent

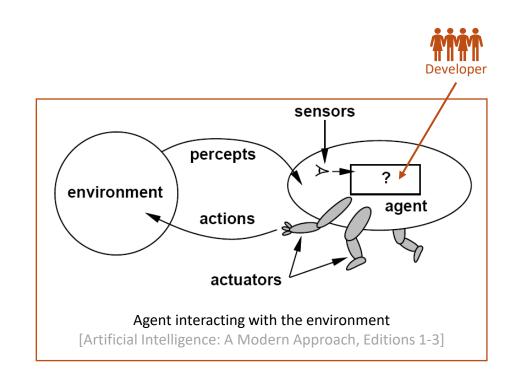

rationally in their environment.

They need to

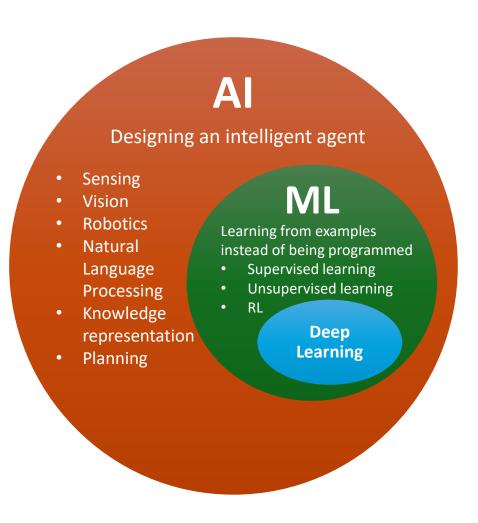

- Communicate with the environment using percepts and actions.
- Represent knowledge, reason and plan to achieve a desired outcome.

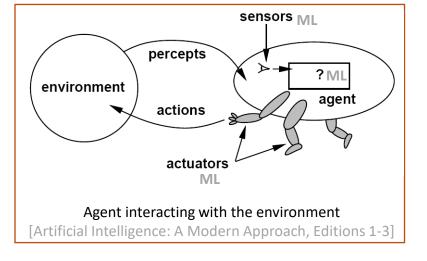

Optional

• **Learn from experience** to improve performance.

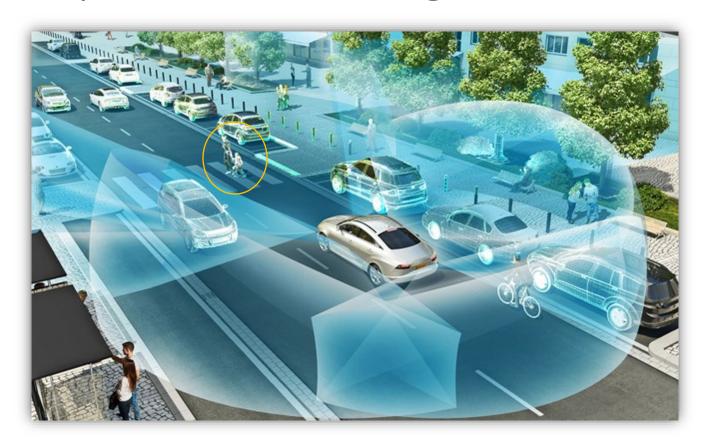

Artificial Intelligence vs. Machine Learning

Example: Self-Driving Car

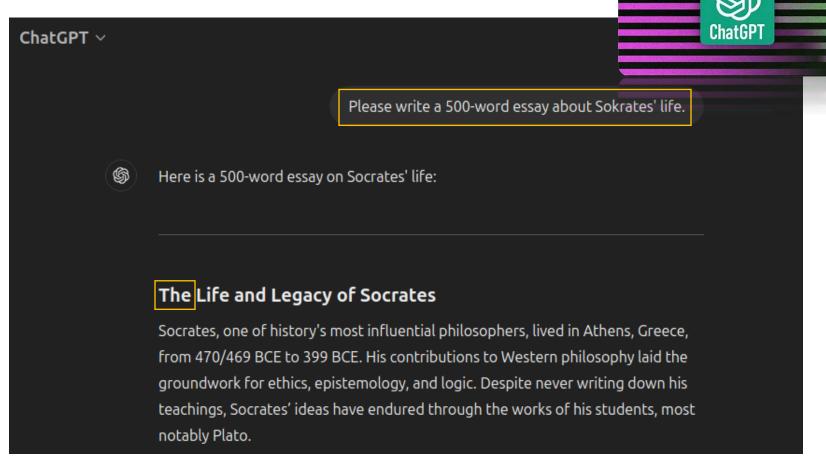

Percepts: Other objects including people crossing the street.

Action: Slow down or stop the car.

Objective: Reach the destination safely

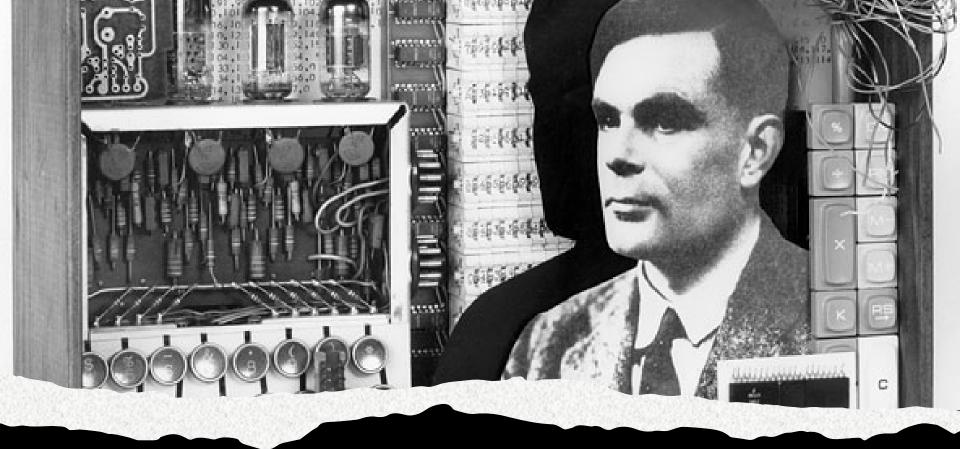

Example: Homework and LLMs

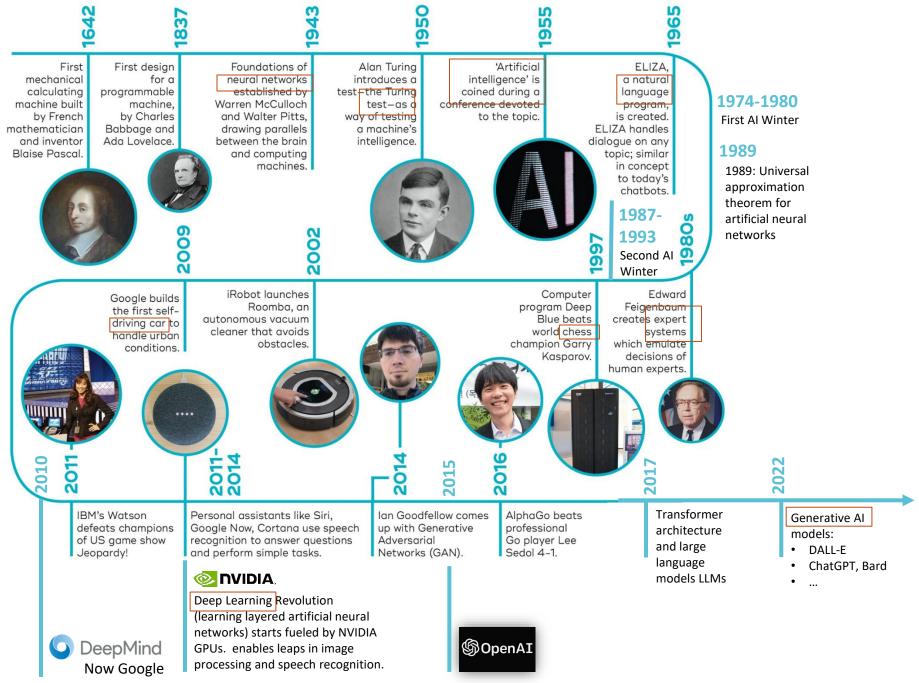

Percept: Your prompt

Action: Next most likely word... More words are created word-by-word.

Objective: You may like a useful answer, but what is ChatGPT's objective?

The History of Al

What accounts for recent successes in AI?

- Dominance of machine learning.
- Faster computers and specialized hardware (GPUs).
- Lots of data (the Internet, text, sensors) and storage (cloud)
- New optimization methods (deep learning).

"Moravec's Paradox"

Hans Moravec (1988): "It is comparatively easy to make computers exhibit adult level performance on intelligence tests or playing checkers, and difficult or impossible to give them the skills of a one-year-old when it comes to perception and mobility."

A teenager can learn how to drive in a few hours with very little input, but we still have no truly self-driving car.

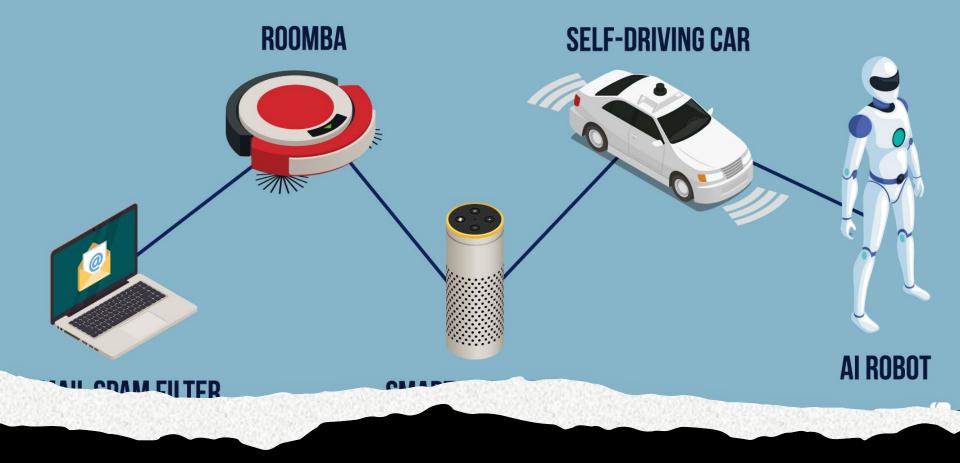

The AI Effect: Al gets no respect?

As soon as a machine gets good at performing some task, the task is no longer considered to require much intelligence.

- Calculating ability used to be prized not anymore.
- Chess was thought to require high intelligence now computers play at a super-human level.
- Learning once thought uniquely human now machine learning is a well-developed discipline.
- Art? "Even a monkey can do this!"

Al Today

Vision and Image Processing

- OCR: read license plates, handwriting recognition (e.g., mail sorting).
- Face detection: now standard for smart phone cameras.
- Vehicle safety systems
- Visual search
- Image generation

All these technologies operate now at superhuman performance.

Natural Language Processing

- Text-to-speech
- Speech-to-text to detect voice commands
- Machine translation
- Text generation (Q/A systems) using Large Language Models

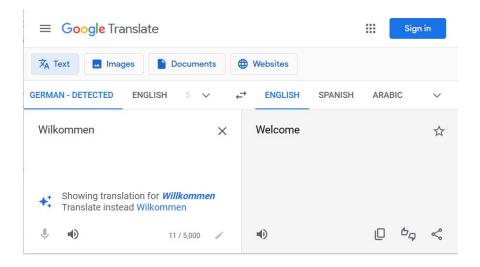

These technologies operate now with close to or even superhuman performance.

Humans use language to reason. Does that mean AI that can create high-quality text can reason?

Language understanding is still elusive!

Robotics

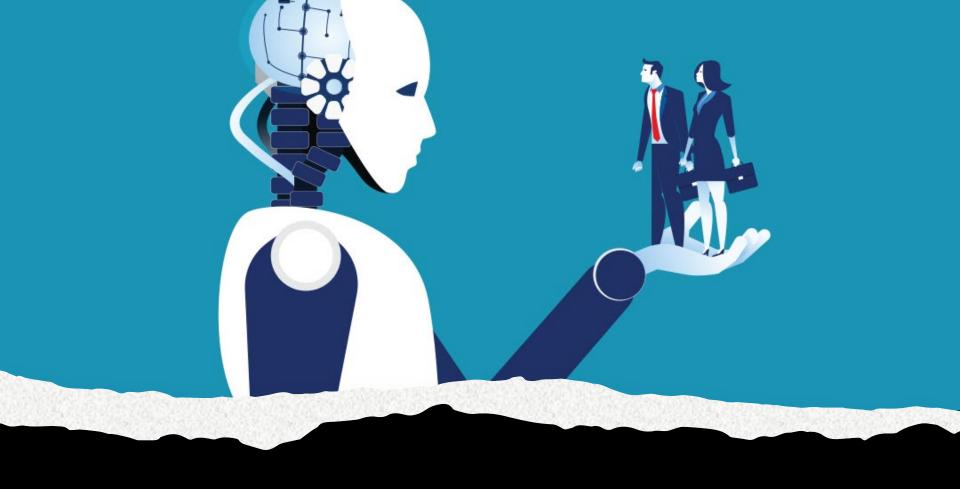

- Mars rovers
- Robot soccer
 - RoboCup
- Autonomous vehicles
 - <u>DARPA Grand</u> <u>Challenge</u>
 - Self-driving cars
- Drones
- Personal robotics
 - Humanoid robots
 - Robotic pets
 - Personal assistants?

Al Ethics & Safety

A new Frontier for Fairness and Freedom AIMA Chapter 27

Commonly-Cited Safety and Ethics Principles

 Ensure safety Use of AI by Limit harmful uses of Al companies and Establish accountability: Liability? organizations Avoid concentration of power: Winner-takes-All Uphold human rights and values. • Ensure fairness: Equal opportunity/equal impact. Reflect diversity/inclusion **Protect** • Provide transparency: Explanations to build trust individuals Respect privacy: Surveillance? • Contemplate implications for employment: Income and purpose. Acknowledge legal/policy implications Governance

Next, we look at the implementation of these principles in different countries.

Has regulations since 2016 included in the General Data Protection Regulation (GDPR)

<u>Art. 22 GDPR – Automated</u> <u>individual decision-making,</u> including

California's CCPA was not modeled after the GDPR

Art. 22 GDPR Automated individual decision making, including profiling

- The data subject shall have the right not to be subject to a decision based solely on
 automated processing, including profiling, which produces legal effects concerning him or
 her or similarly significantly affects him or her.
- Paragraph 1 shall not apply if the decision:
 - is necessary for entering into, or performance of, a contract between the data subject and a data controller;
 - (b) is authorised by Union or Member State law to which the controller is subject and which also lays down suitable measures to safeguard the data subject's rights and freedoms and legitimate interests; or
 - (c) is based on the data subject's explicit consent.
- 3. In the cases referred to in points (a) and (c) of paragraph 2, the data controller shall implement suitable measures to safeguard the data subject's rights and freedoms and legitimate interests, at least the right to obtain human intervention on the part of the controller, to express his or her point of view and to contest the decision.
- 4. Decisions referred to in paragraph 2 shall not be based on special categories of personal data referred to in Article 9(1), unless point (a) or (g) of Article 9(2) applies and suitable measures to safeguard the data subject's rights and freedoms and legitimate interests are in place.

In the United States

Did not toceive a vote in constess.

116TH CONGRESS H.R. 2231

To direct the Federal Trade Commission to require entities that use, store, or share personal information to conduct automated decision system impact assessments and data protection impact assessments.

- (2) AUTOMATED DECISION SYSTEM IMPACT ASSESSMENT.—The term "automated decision system impact assessment" means a study evaluating an automated decision system and the automated decision system's development process, including the design and training data of the automated decision system, for impacts on accuracy, fairness, bias, discrimination, privacy, and security that includes, at a minimum—
 - (A) a detailed description of the automated decision system, its design, its training, data, and its purpose;
 - (B) an assessment of the relative benefits and costs of the automated decision system in light of its purpose, taking into account relevant factors, including-
 - (i) data minimization practices;
 - (ii) the duration for which personal information and the results of the automated decision system are stored;
 - (iii) what information about the automated decision system is available to consumers;
 - (iv) the extent to which consumers have access to the results of the automated decision system and may correct or object to its results; and
 - (v) the recipients of the results of the automated decision system;
 - (C) an assessment of the risks posed by the automated decision system to the privacy or security of personal information of consumers and the risks that the automated decision system may result in or contribute to inaccurate, unfair, biased, or discriminatory decisions impacting consumers; and
 - (D) the measures the covered entity will employ to minimize the risks described in subparagraph (C), including technological and physical safeguards.

European Union Study

A governance framework for algorithmic accountability and transparency

This study develops policy options for the governance of algorithmic transparency and accountability, based on an analysis of the social, technical and regulatory challenges posed by algorithmic systems. Based on a review and analysis of existing proposals for governance of algorithmic systems, a set of four policy options are proposed, each of which addresses a different aspect of algorithmic transparency and accountability: 1. awareness raising: education, watchdogs and whistleblowers; 2. accountability in public-sector use of algorithmic decision-making; 3. regulatory oversight and legal liability; and 4. global coordination for algorithmic governance.

Background

Google has long championed Al. Our research teams are at the forefront of Al development, and we've seen firsthand how Al can enable massive increases in performance and functionality. Al has the potential to deliver great benefits for economies and society — from improving energy efficiency and more accurately detecting disease, to increasing the productivity of businesses of all sizes. Harnessed appropriately, Al can also support fairer, safer and more inclusive and informed decision-making. We are keen to ensure that everyone and every business can benefit from the opportunities that Al creates.

Al will have a significant impact on society for many years to come. That's why we established our Al Principles (including applications we will not pursue)¹ to guide Google teams on the responsible development and use of Al. These are backed by the operational processes and structures necessary to ensure they are not just words but concrete standards that actively impact our research, products and business decisions to ensure trustworthy and effective Al application.

But while self-regulation is vital, it is not enough. Balanced, fact-based guidance from governments, academia and civil society is also needed to establish boundaries, including in the form of regulation. As our CEO Sundar Pichai has noted, Al is too important not to regulate. The challenge is to do so in a way that is proportionately tailored to mitigate risks

US White House Executive Order 14110

OCTOBER 30, 2023

Executive Order on the Safe, Secure, and Trustworthy Development and Use of Artificial Intelligence

By the authority vested in me as President by the Constitution and the laws of the United States of America, it is hereby ordered as follows:

Section 1. Purpose. Artificial intelligence (AI) holds extraordinary potential for both promise and peril. Responsible AI use has the potential to help solve urgent challenges while making our world more prosperous, productive, innovative, and secure. At the same time, irresponsible use could exacerbate societal harms such as fraud, discrimination, bias, and disinformation; displace and disempower workers; stifle competition; and pose risks to national security. Harnessing AI for good and realizing its myriad benefits requires mitigating its substantial risks. This endeavor demands a society-wide effort that includes government, the private sector, academia, and civil society.

Some important points:

- **Artificial** Intelligence must be safe and secure.
- Promoting responsible innovation, competition, and collaboration
- Americans' privacy, civil liberties and labor rights must be protected.

January 2025: This **Executive Order is** now revoked.

Fairness: Algorithmic Bias

"Algorithmic bias describes systematic and repeatable errors in a computer system that create unfair outcomes, such as privileging one arbitrary group of users over others." [Wikipedia]

Pre-existing bias

Social and institutional norms influence design and training data choices.

Example: Evaluate job applicants for a job which is historically almost exclusively held by males.

Technical bias

Limitations of a program or computational power.

Example: Algorithm uses data that is easy to obtain but biased.

Emergent bias

Use and reliance on algorithms across new or unanticipated contexts.

Example: Use a large language model to support job candidate selection.

Types of AI Safety

"Prevent accidents, misuse, or other harmful consequences of AI."

Al Testing Monitoring Al

Adversarial robustness

How should this be ensured?

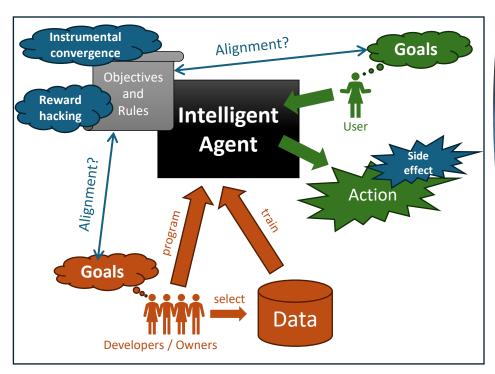

- Corporate self-regulation
- Private watchdogs
- Government action
- International treaties

Is it reasonable to assume that a superintelligent AI can get around being tested and monitored?

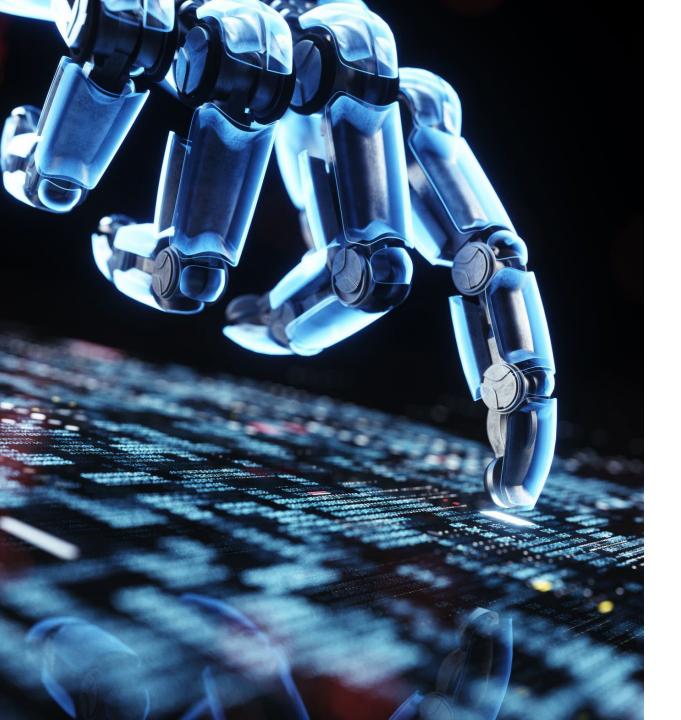

Al Safety and Optimizers

Intelligent Agents are "optimizers!"

- **Goal/reward alignment**: How do we specify a robust objective function? Whose objectives are used?
- **Reward hacking:** The AI learns to exploit unintended side effects to get a high "score" without solving the objective. AI needs to follow social norms.
- Instrumental convergence: All intelligent agents will pursue common subgoals like the need for more power to get better at reaching its objectives. How will this need be balanced with human's needs?

Outlook

Al is a technology that is on the verge of significant leaps...

- New technologies always had a profound impacted on the way we live and work (e.g., electricity, the internet, mobile communication).
- We can expect unprecedented gains in productivity from better narrow AI.
- New technologies always also present dangers and need to be regulated.

This course will introduce simple techniques to create intelligent agents.
